Methods

The petrographical characteristics of the Berrio Gabbro rock types occurring in the Mont Gelé and Regondi Units and of the mafic and ultramafic rocks of the Tsaté Unit are reported below. Table S1 in the Supporting Information is a compilation of the studied samples. The deformation/mineral growth relationships (D_n , M_n) of the Berrio Gabbro rocks are summarized in Figure S1. The main field and micro-scale characters of the mafic and ultramafic rocks from the Berrio Gabbro and of the Tsaté Unit are illustrated in Figure 5, 6, S2, and S3 (Supporting Information). Representative analyses of selected minerals are given in Table S2 and in Tables S3 and S4.

Mineral analyses were performed with a Cameca SX100 electron microprobe (Microsonde Ouest, Brest, France) operating in the wavelength dispersive mode. Operating conditions for spot analyses were set to 15 keV, 20 nA and 10 s counting time on the peak (spot size = 1 μm). The $\varphi(\rho Z)$ matrix correction was applied based on Pouchou & Pichoir (1985). Standards were albite (Na, Si), orthoclase (K), corundum (Al), wollastonite (Ca), forsterite (Mg), MnTiO₃ (Mn, Ti), andradite (Fe), Cr₂O₃ with Cr = 68.42 wt.% (Cr), NiO with Ni = 78.58 wt.% (Ni) and apatite (P).

Mineral abbreviations are those used by Whitney & Evans (2010), with mu for muscovite (whatever the Si content) and Mchl for Mg-rich chlorite (Fig. S1). Other symbols (mole/atomic proportions): $X_{\text{Mg}} = \text{Mg}/(\text{Mg} + \text{Fe})$ (amphibole, clinopyroxene, chlorite, serpentine); per formula unit (p.f.u.); weight per cent (wt%), mole per cent (mol.%), Mg# = (molar Mg/(Mg+Fe_T)).

Major and minor elements were determined in whole-rock samples by ICP-AES (CRPG, Nancy) and incompatible trace elements by ICP-MS, respectively. Bulk-rock glasses were prepared by mixing appropriate proportions (1:5) of fine-grained rock powder with di-lithium tetraborate. Details about the method used for the analyses are available in Carignan *et al.* (2001).

Table S1. Location of studied samples from the Arolla Series (Dent Blanche nappe) and Tsaté Unit.

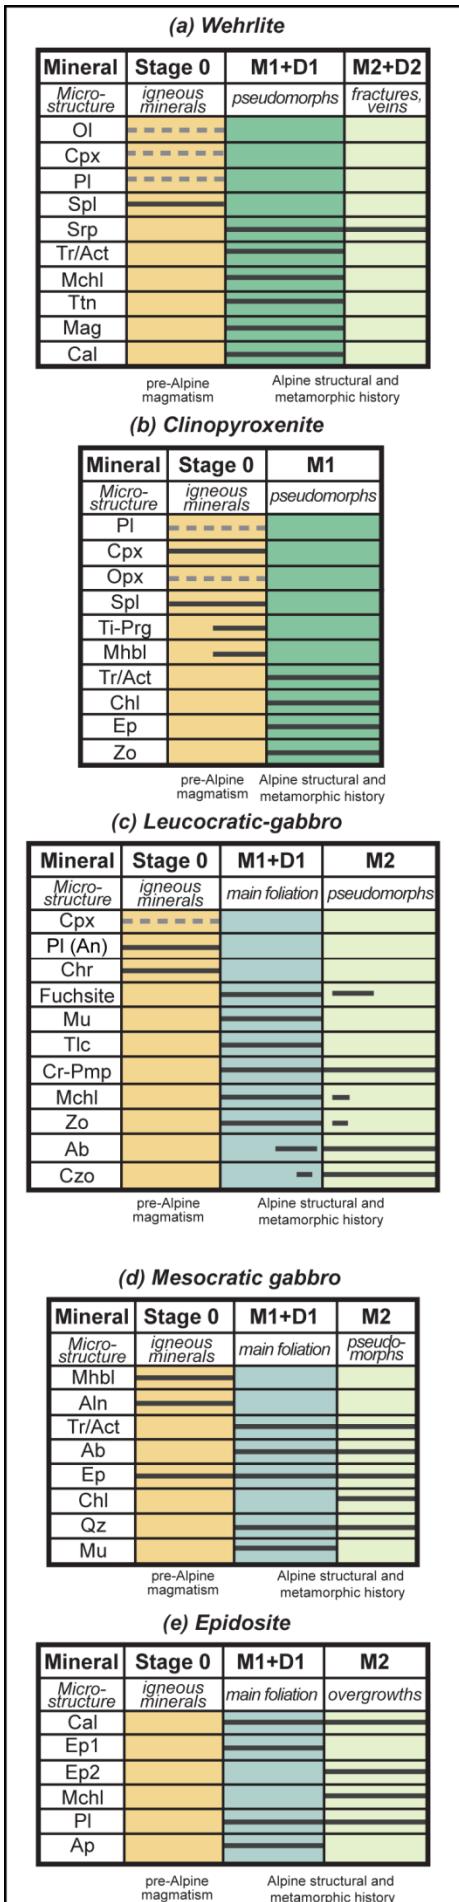

Figure S1. Deformation/mineral growth relationships in the rocks of the BG. **(a)** Pl±wehrlite. **(b)** Clinopyroxenite. **(c)** Leucocratic gabbro. **(d)** Mesocratic gabbro. **(e)** Epidosite.

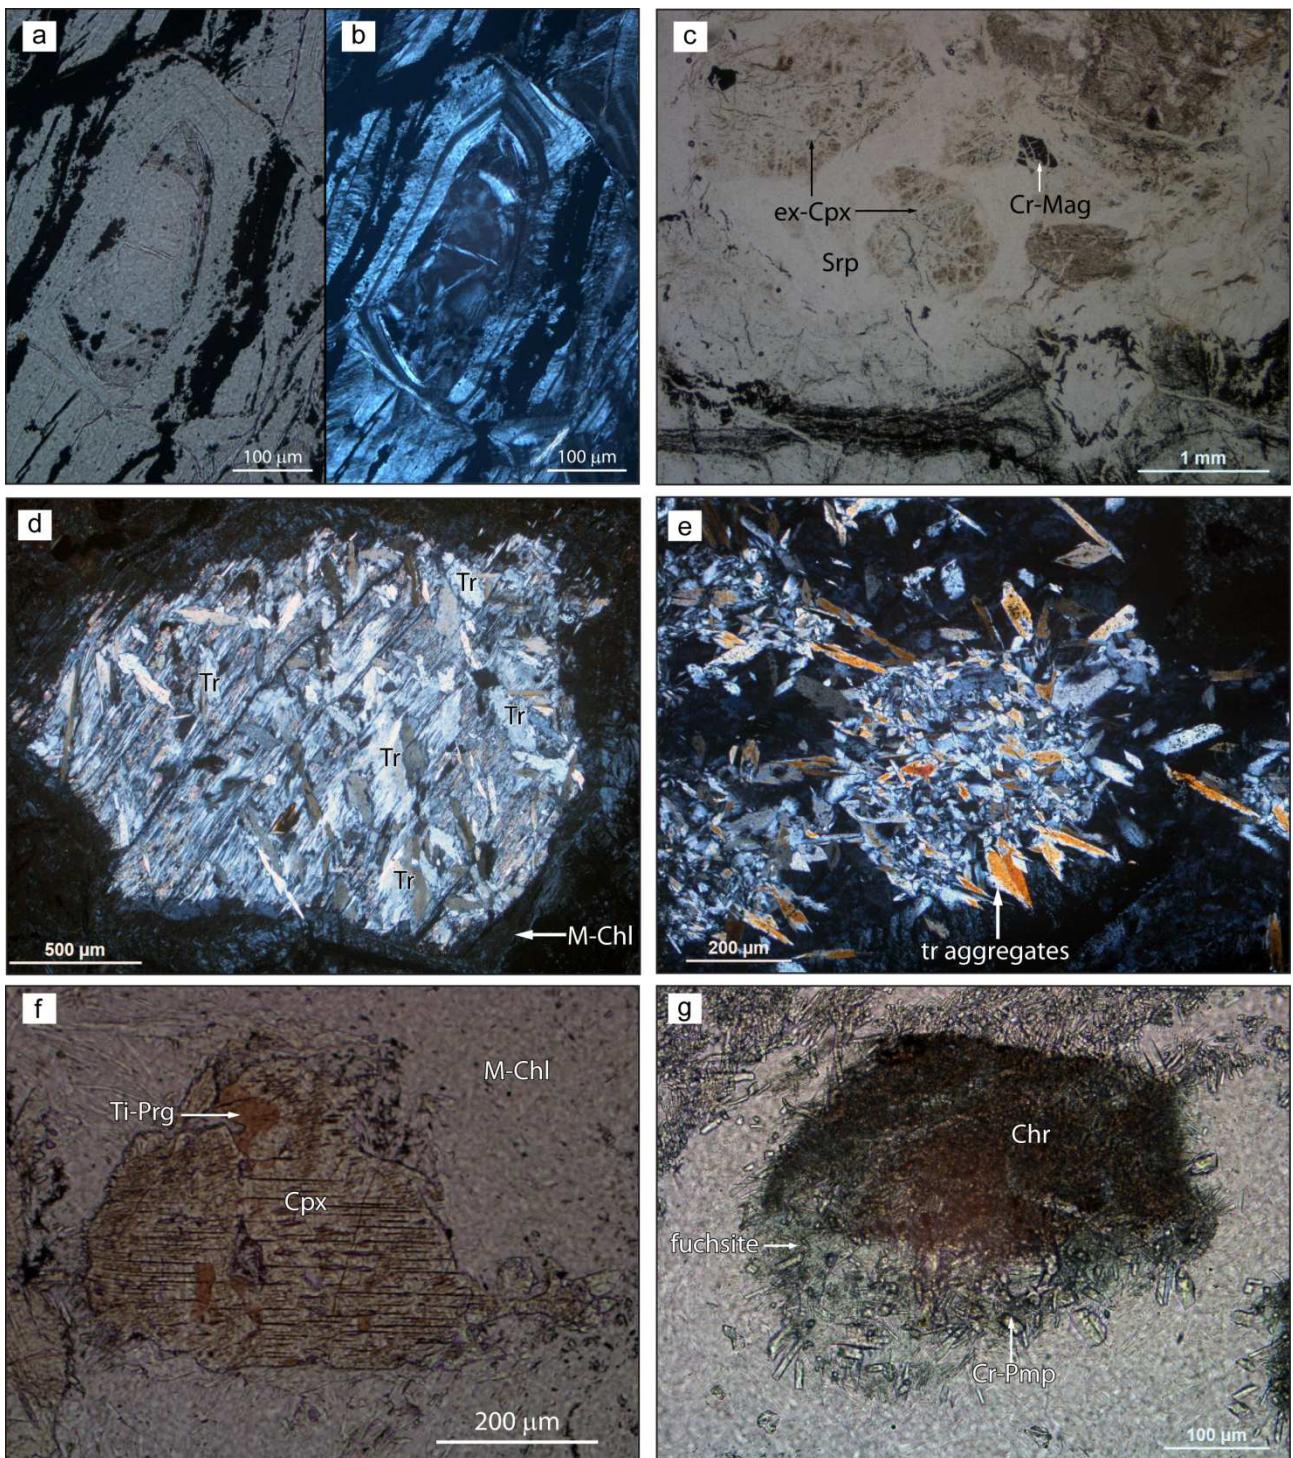

Figure S2. Thin section photomicrographs from the Berrio Gabbro ultramafic and mafic rocks. (a) Lizardite pseudomorphing olivine with mesh texture in a wehrlite (sample 22, plane polarised light) (PPL). (b) The same as (a) under CPL (c) Ex-clinopyroxene in a wehrlite, replaced by aggregates of tremolite – calcite – Mg-chlorite - titanite. Cr-spinel is replaced by Cr-magnetite and Mg-chlorite (sample 42, PPL). (d) Clinopyroxene replaced by pseudomorphic aggregates of tremolite, Mg-rich chlorite and fine-grained calcite (not indicated in the photograph due to its small size) (sample 42, CPL). (e) Tremolite replacing unknown intercumulus phase in a wehrlite (sample 22, CPL). (f) Clinopyroxene in a clinopyroxenite with small interstitial Ti-pargasite (sample 29, PPL). (g) Chromite pseudomorph partially preserving chromite relicts (with up to 37 wt.% Cr_2O_3) largely replaced by chromian pumpellyite and fuchsite (sample 21, PPL).

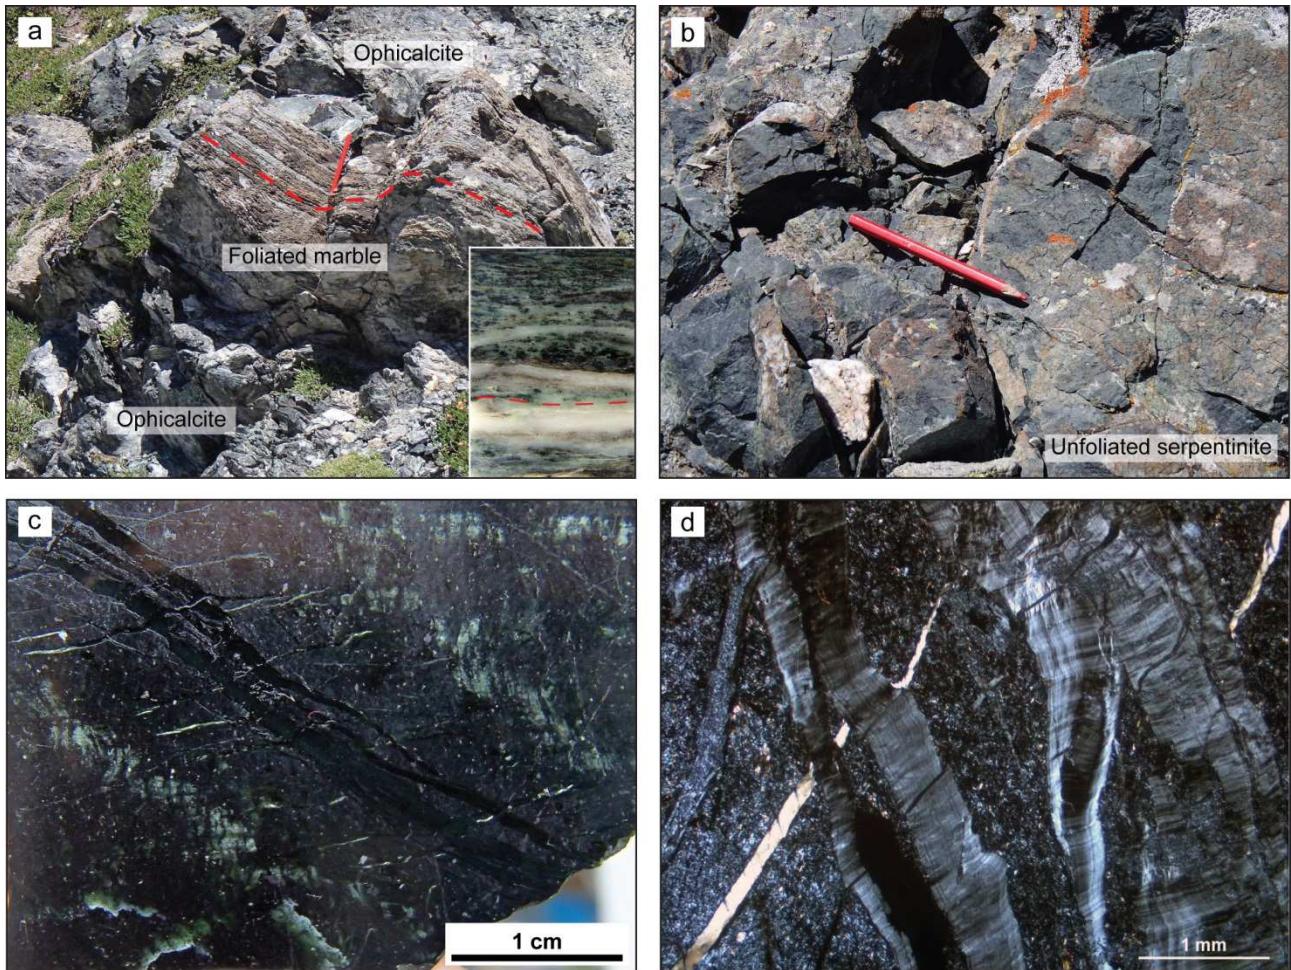

Figure S3. Field aspects of rocks from the Tsaté Unit at various scale. UTM ED 1950 coordinates for field photograph are given. (a) Field aspect of ophicalcite with foliated marble layers (369528/5081489). The inset shows the polished surface of a foliated marble. (b) Field aspect of massive serpentinite (369546/5081461) (c) Polished surface of a massive serpentinite (sample 35; 372586/5085449), characterized by late serpentine veins. (d) Thin section photomicrograph of a massive serpentinite with serpentine veins (sample 35, crossed polarised light) (CPL). Serpentine occurs as very fine-grained crystals.
